

# Experimental Design

Thomas Wolbers  
Space and Aging Laboratory  
Centre for Cognitive and Neural Systems

# Overview

SPM Course Edinburgh 2010

## **Design of functional neuroimaging studies**

- Categorical designs
- Factorial designs
- Parametric designs
- fMRI adaptation
- Control conditions
- Trial timing

# Categorical Designs

SPM Course Edinburgh 2010

## Subtraction logic in psychophysics

Assumption of pure insertion:

- ⇒ you can insert a component process into a task without disrupting the other components
- ⇒ you can estimate duration of a cognitive process by comparing reaction times between different conditions

*F.C. Donders*

# Categorical Designs

SPM Course Edinburgh 2010

## T1: Simple Reaction Time

- Hit button when you see a light

## T2: Discrimination Reaction Time

- Hit button when light is green but not red

## T3: Choice Reaction Time

- Hit left button when light is green and right button when light is red

# Categorical Designs

# Categorical Designs

SPM Course Edinburgh 2010

# Categorical Designs

SPM Course Edinburgh 2010

## Background

- ⇒ pure insertion: you can insert a component process into a task without disrupting the other components
- ⇒ additional cognitive processes always evoke the same additional activation!
- ⇒ activation due to baseline task unaffected!

## Simple subtraction

- you can identify functionally specialised regions with regionally specific activation differences

moving dots

—

fixation

# Categorical Designs

SPM Course Edinburgh 2010

## Serial subtraction

Question: Is inferior temporal cortex (IT) involved in phonological retrieval during object recognition?

## Cognitive processes

- ⇒ visual analysis: occipital cortex
- ⇒ object recognition: ???
- ⇒ phonological retrieval: ???
- ⇒ verbal output: Broca's area

# Categorical Designs

SPM Course Edinburgh 2010

## Experimental design

**A** say „yes“ when you see an abstract image  
(*vis. analysis, verbal output*)

⇒ yes

**B** say „yes“ when you see a concrete object  
(*vis. analysis, object recognition, verbal output*)

⇒ yes

**C** name concrete object  
(*vis. analysis, object recognition, phonological retrieval, verbal output*)

⇒ butterfly

# Categorical Designs

SPM Course Edinburgh 2010

<b>A</b>	visual analysis verbal output	-----
<b>B</b>	visual analysis <b>object recognition</b> verbal output	<b>C</b> visual analysis object recognition <b>phonological retrieval</b> verbal output

**B - A**  $\Rightarrow$  significant IT activation  $\Rightarrow$  object recognition!

**C - B**  $\Rightarrow$  no significant IT activation  $\Rightarrow$  no evidence for IT involvement in phonological retrieval!

**Problem:** unjustified assumption that IT response to object recognition is context independent!

$\rightarrow$  psychophysics  $\neq$  neurophysiology

# Factorial Designs

SPM Course Edinburgh 2010

## Background

- “the whole is more than just the sum of its parts”
- cognitive processes are interdependent  $\Rightarrow$  task A interacts with task B, A modulates sensitivity to B ...

interaction term  
(task B x task D)

# Factorial Designs

SPM Course Edinburgh 2010

**D** Name colour of abstract image  
(*vis. analysis, phonological retrieval, verbal output*)

⇒ green

	no phonolog. retrieval	phonolog. retrieval
no object recogn.	<b>A</b> visual analysis verbal output	<b>D</b> visual analysis phonological retrieval verbal output
object recognit.	<b>B</b> visual analysis <b>object recognition</b> verbal output	<b>C</b> visual analysis <b>object recognition</b> phonological retrieval verbal output

**Interaction:**  $(C - D) - (B - A)$  ⇒ significant IT activation

- phonological retrieval modulates IT response to object recognition  
⇒ IT also involved in phonological retrieval!

# Parametric Designs

SPM Course Edinburgh 2010

	cognitive processes
categorical/factorial designs	binary
parametric designs	continuous

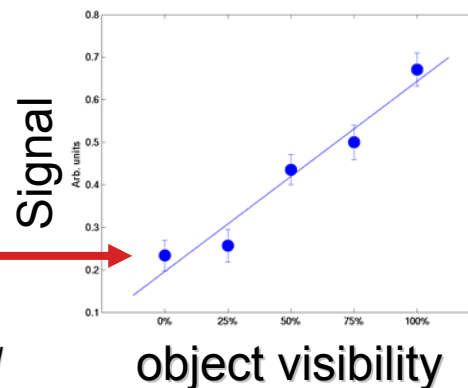

↓ ↓ ↓

Systematic variation of regional activation with endo-/exogenous parameters

- ⇒ task stays the same while the amount of processing varies; thus, changes to the nature of the task are less of a problem
- ⇒ you can test for both linear (i.e. level of sensorimotor/cognitive processing) and non-linear effects (i.e. time effects)

Rose et al. (2005). *Cerebral Cortex*.

Example 1: linear activation increase in LOC with increasing object visibility!

# Parametric Designs

SPM Course Edinburgh 2010

Example 2: Non-linear decrease of prefrontal activation over time during procedural learning!

## Combining parametric and factorial designs

linear interaction

non-linear interaction

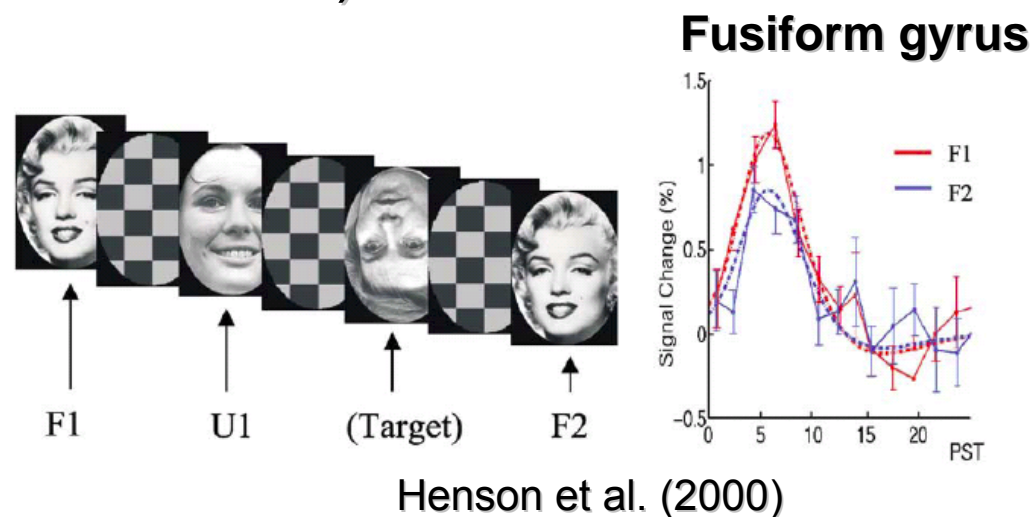

Rainer et al. (2001). *Current Biology*.

# fMRI Adaptation

SPM Course Edinburgh 2010

## fMRI adaptation

- priming = reduced BOLD response to primed stimuli (i.e. repeated presentation)

repetition suppression / fMRI adaptation / priming

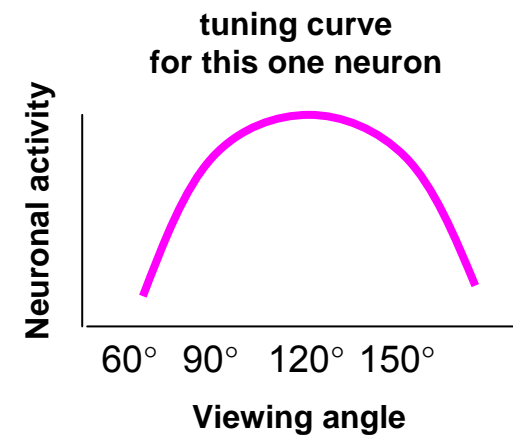

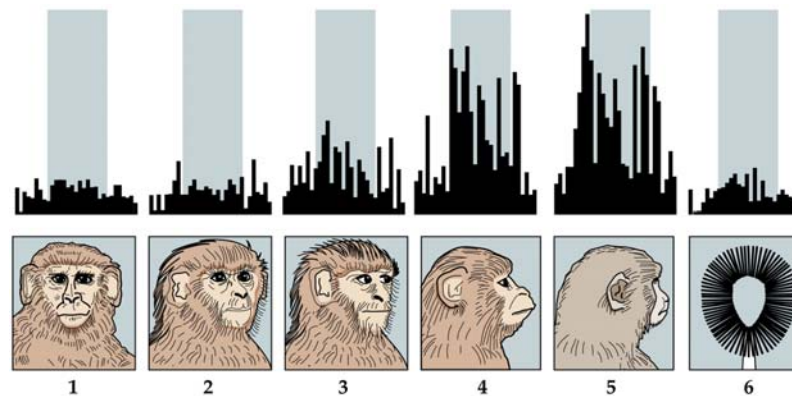

# fMRI Adaptation

SPM Course Edinburgh 2010

## Priming as a tool

- increase in spatial resolution (hyperresolution)
- example: orientation tuning for face stimuli

monkey STS

⇒ viewpoint selectivity in the human FFA?

# fMRI Adaptation

SPM Course Edinburgh 2010

## Priming as a tool

- fMRI – voxel typically contain ten thousands of neurons
- FFA: mixture of neurons tuned to different orientations?

identical BOLD response to each orientation!

Slide modified from Jody Culham

# fMRI Adaptation

SPM Course Edinburgh 2010

## orientation tuning in the human FFA?

‘same’  
stimuli

predicted BOLD-  
responses

‘different’  
Stimuli

Slide modified from Jody Culham

# fMRI Adaptation

SPM Course Edinburgh 2010

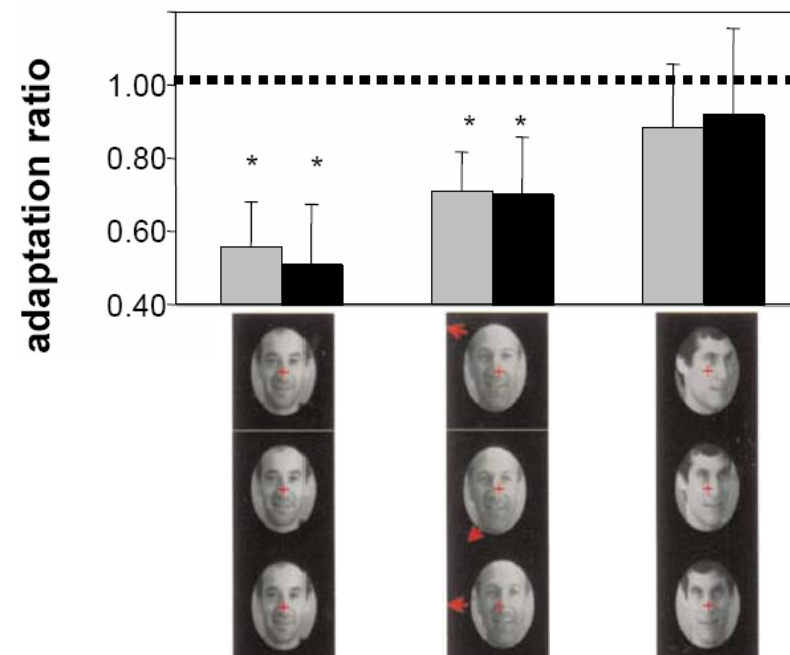

## orientation tuning in the human FFA?

faces vs. objects

Grill-Spector & Malach (2001), Acta Psychol.

fMRI adaptation

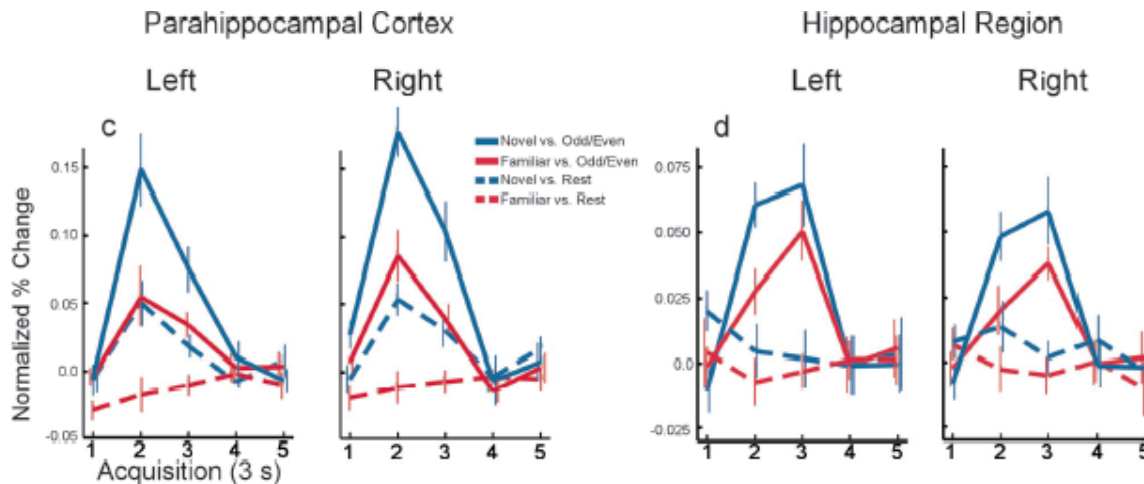

# Control Condition

SPM Course Edinburgh 2010

## Problem

- fMRI = contrastive method
  - ⇒ for many designs, you need to include adequate control conditions

Stark & Squire (2001) – When zero is not zero... *PNAS*, 98(22), 12760-12766.

„Rest“ = often substantial activation in many areas!

⇒ reason: mental imagery / rehearsal / eye movements...

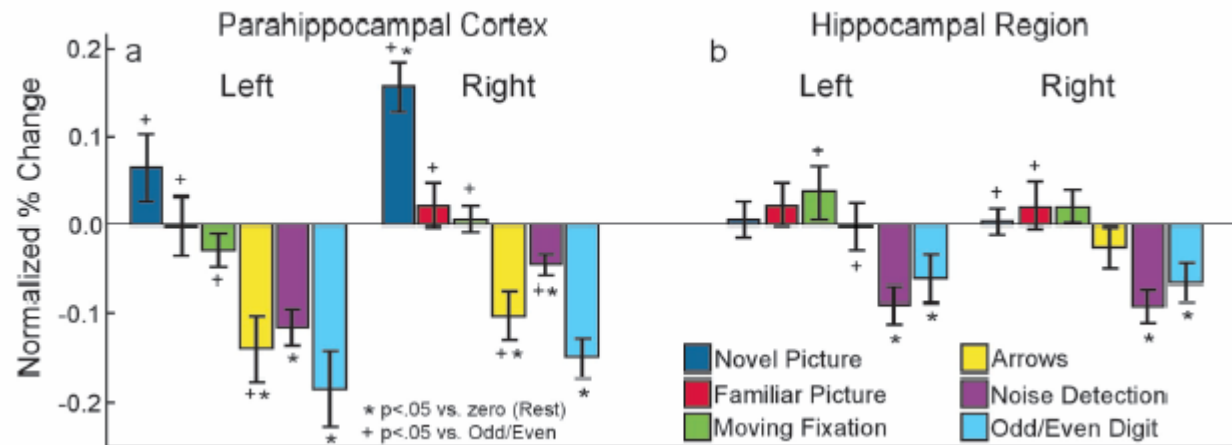

⇒ loss of sensitivity!

# Control Condition

SPM Course Edinburgh 2010

## Alternatives

1. high congruency with experimental conditions
2. additional possibilities:

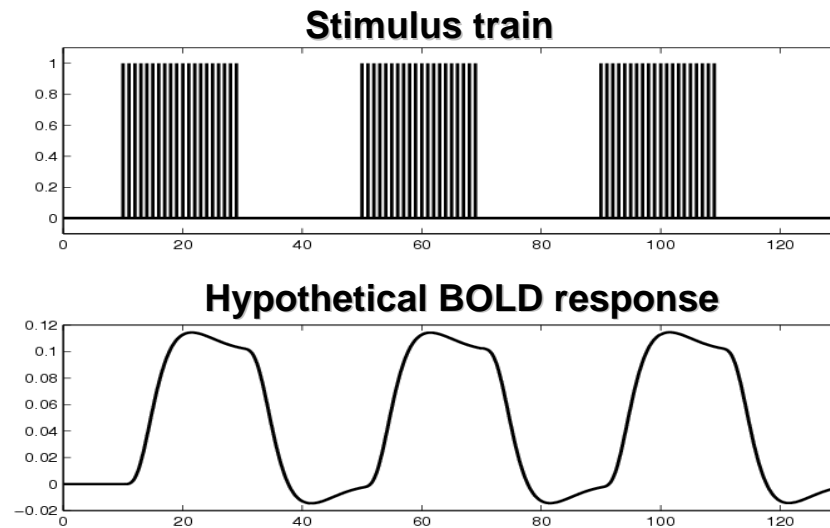

Stark & Squire (2001) – When zero is not zero... *PNAS*, 98(22), 12760-12766.

⇒ decision depends on experimental hypotheses!

# Trial timing

SPM Course Edinburgh 2010

## Block Design

- analysis of entire block, not of single stimuli
- large effects
- Optimal block length: ~16sec
  - ⇒ allows enough time for signal to oscillate fully
  - ⇒ not near artifact frequencies

## Event-Related Design

- analysis of single stimuli
- smaller effects
- minimal SOA: ~2sec

# Trial timing

SPM Course Edinburgh 2010

## Advantages of event-related design

- randomised order avoids unwanted psychological effects  
*e.g. habituation / expectancy effects, attentional decline*

# Trial timing

SPM Course Edinburgh 2010

## Blocked

## Randomised

*Slide modified from Rik Henson*

# Trial timing

SPM Course Edinburgh 2010

## Advantages of event-related design

- randomised order avoids unwanted psychological effects  
*e.g. habituation / expectancy effects, attentional decline*
- post-hoc/subjective classification of trials  
*e.g. subsequent memory effect*

# Trial timing

SPM Course Edinburgh 2010

**R = Words Later Remembered**

**F = Words Later Forgotten**

*Slide modified from Rik Henson*

# Trial timing

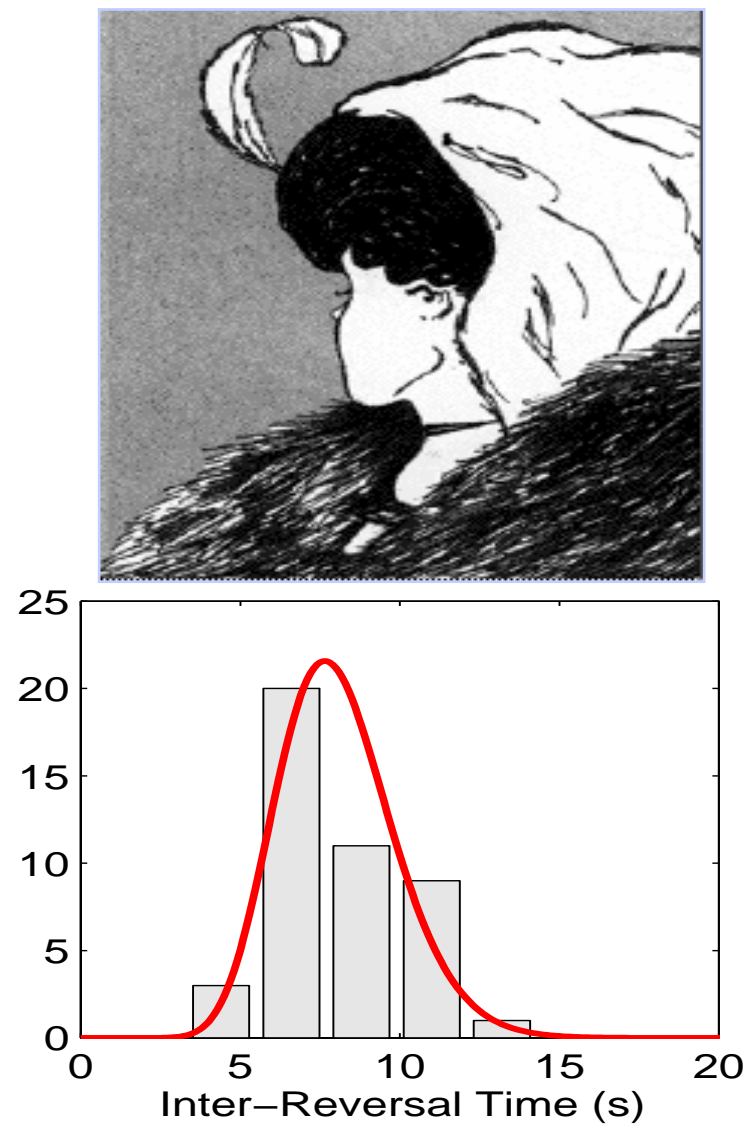

SPM Course Edinburgh 2010

## Advantages of event-related design

- randomised order avoids unwanted psychological effects  
*e.g. habituation and expectancy effects, attentional decline*
- post-hoc/subjective classification of trials  
*e.g. subsequent memory effect*
- some events can only be indicated by subject (in time)  
*e.g. spontaneous perceptual changes*

# Trial timing
